

# Third International Workshop on Affective Computing in Requirements Engineering

A workshop in conjunction with **RE'20** on September 1, 2020 in Zurich, Switzerland.

**Overview** — Affective computing spans a broad research field from the recognition to the expression of emotions, which is of interest for software systems as they are designed and used by humans. For requirements engineering (RE), understanding and utilizing personality traits, attitudes, moods, and emotions play a crucial role in various facets, reaching from the consideration of individual professionals and team performance during RE activities to the utilization of end user emotions as a means to verify and validate requirements.

**Goal** — The AffectRE workshop aims at creating an international, sustainable community where researchers and practitioners can meet, present, and discuss their current work to *affect* the RE community with ideas from affective computing. In its third edition, this workshop fosters high-quality contributions about empirical studies, theoretical models, and tools that raise emotion awareness in RE.

**Topics of Interest** include, but are not limited to:

- Automatic recognition and impact assessment of affective and cognitive states (affects, emotions, moods, attitudes, personality traits) on individual and group performance, commitment and collaboration in RE;
- Methods and artifacts for elicitation and modelling of emotional requirements, including the relevant approaches of participatory design (co-design);
- Leveraging stakeholders' affective feedback to improve requirements, tools, and processes (e.g., capture and analyze the sentiment of users and community feedback, aspect-based sentiment analysis of product reviews);
- Exploration of biometric sensors emerging from new (consumer) hardware which enable new measurement techniques to support the verification and validation of both functional and nonfunctional requirements;
- Interaction between RE and other software lifecycle activities, such as testing, from emotional and cognitive perspectives (e.g., in the communication between requirements engineers and testers);
- Design, development, and evaluation of frameworks and tools to support emotion and cognition awareness in RE;
- Defining or adapting psychological models of affect to RE (e.g., understanding the trigger behind positive and negative emotions during the requirement engineering process, modeling coarse vs. fine-grained emotion);
- Affective and cognitive state detection from the multimodal analysis of spontaneous communicative behavior, such as natural language, body postures and gestures, speech, or conversations;
- Sensing from communication artifact (e.g., message boards, social media) and techniques/tools for extracting and summarizing emotions from such channels;
- Interplay between affect and exogenous or endogenous workplace factors (e.g., physical location of the stakeholders, organizational hierarchy, adopted technologies);
- Emotion and cognition awareness in cross-cultural stakeholder teams (e.g., in global software development);
- Software frameworks, APIs, and patterns for designing and maintaining RE affect- and cognitive-aware systems (e.g., for integrating their sensing in requirements management tools).

## Submissions

- **Full research papers** (up to 6 pages) describe original work, such as novel approaches or frameworks, which are supported by initial validation results. Empirical evaluations and industrial experience reports are welcomed as well.
- **Short position papers** (up to 4 pages) describe a new idea or work in progress that is currently in an early development stage.
- **Extended abstracts** (up to 2 pages) outline a research project or *newly developed* tools, techniques or datasets, which must be supported by a poster on the workshop day.
- **Promotional summaries** (up to 2 pages) outline the use of *established* software or hardware for affective computing that may be new but of interest to the RE community. Authors should prepare an interactive presentation to promote and demonstrate why such software or hardware can be useful. This presentation should also contain a part that teaches how they can be used.

## Important Dates

All deadlines are due at 23:59:59 AoE.

Abstract Submission: May 15, 2020 Optional

Paper Submission: May 22 → 29, 2020 Extended

Author Notification: June 22, 2020 Sent

Camera-Ready Submission: July 13, 2020

## Organization Committee

Jan Ole Johanssen  
Technical University of Munich, Germany  
Kuldar Taveter  
University of Tartu, Estonia  
James Tizard  
University of Auckland, New Zealand  
Kelly Blincoe  
University of Auckland, New Zealand

## Program Committee

Bram Adams  
Polytechnique Montréal (Canada)  
Raian Ali  
Hamad Bin Khalifa University (Qatar)  
Muneera Bano  
Deakin University (Australia)  
Rachel Burrows  
Google (UK)  
Cristina Conati  
The University of British Columbia (Canada)  
Fabiano Dalpiaz  
Utrecht University (The Netherlands)  
Giuseppe Destefanis  
Brunel University (UK)  
Davide Fucci  
Blekinge Institute of Technology (Sweden)  
Eduard C. Groen  
Fraunhofer IESE (Germany)  
Rashina Hoda  
Monash University (Australia)  
Seok-Won Lee  
Ajou University (Republic of Korea)  
Julio Cesar Leite  
PUC-Rio (Brazil)  
Anas Mahmoud  
Louisiana State University (USA)  
Daniel Martens  
University of Hamburg (Germany)  
Antonette Mendoza  
The University of Melbourne (Australia)  
Maleknaz Nayebi  
Polytechnique Montréal (Canada)  
Nicole Novielli  
University of Bari (Italy)  
Barbara Paech  
Heidelberg University (Germany)  
Kurt Schneider  
Leibniz University Hannover (Germany)  
Alexander Serebrenik  
Eindhoven Uni. of Technology (The Netherlands)  
Bonita Sharif  
University of Nebraska - Lincoln (USA)  
Paola Spoletini  
Kennesaw State University (USA)  
Leon Sterling  
Swinburne University of Technology (Australia)  
Jordi Vallverdú  
Universitat Autònoma de Barcelona (Spain)  
Didar Zowghi  
University of Technology Sydney (Australia)
